- Financial Analysis
- Expectations for Next Module

Project Objective

This project aims to implement a dynamic pricing system to optimize the occupancy of radio advertising slots, adapting in real-time to variables such as demand, seasonality, and peak hours. The initiative seeks to maximize revenue through automatically adjusted prices while offering attractive and predictable conditions for advertisers.

Detailed User Profiles and Understanding of Their Needs

Sprint 2

Persona

Marcos Silva

Comercial manager

- Age: 42
- Interests: Loves following market trends
- Values: Collaboration with the team and prefers quick, focused meetings.
- Experience: 15 years as Commercial Manager at Rede Gazeta.

01

Goals

- Implement a system to predict advertising inventory occupancy
- Automatically adjust prices to maintain competitiveness and maximize occupancy

02

Needs

- Reliable data to forecast demand and seasonality
- Tools that facilitate performance analysis and enable real-time adjustments

03

Desires

- Market recognition for efficiency and innovation in pricing strategies
- Consistent growth in advertising revenue, ensuring greater visibility for advertisers

04

Challenges

- Difficulty in predicting and adjusting prices quickly, impacting competitiveness
- Constant pressure to maximize occupancy during low-demand periods

05

KPIs

- Advertising inventory occupancy rate
- Total revenue growth from advertising

Persona

Paula Mendes

Data analyst

- Age: 29
- Interests: Constantly seeks courses and certifications to stay updated.
- Experience: Joined Rede Gazeta 3 years ago.

01

Goals

- Use a system that provides detailed and up-to-date reports on inventory occupancy
- Contribute to more accurate sales and pricing strategies based on data

02

Needs

- Visualization tools to quickly identify market trends
- Easy access to real-time and historical data on occupancy and sales

03

Desires

- To be recognized within the team for her data-driven analysis and recommendations
- Automated processes for report generation and performance alerts

04

Challenges

- Lack of robust tools for analyzing large volumes of occupancy data
- Difficulty in correlating information from different sources (market, sales, seasonality)

05

KPIs

- Response time for generating reports and data analysis
- Number of price and sales recommendations accepted by the sales team

User story

Epic	Dynamic Real-Time Pricing
Persona	Commercial Manager
User Story	As a Commercial Manager, I want the system to predict inventory occupancy and automatically adjust prices based on seasonality and demand to maximize occupancy and maintain the competitiveness of Rede Gazeta.
Acceptance Criteria	• The system must be able to predict inventory occupancy for the next three months. • The system must suggest price adjustments based on historical data and market trends. • Minimum and maximum price limits must be configurable.
Acceptance Tests	• The system receives occupancy data, seasonality, and history and generates an occupancy forecast for the next three months. If the forecast is accurate, the test passes. If the prediction fails, errors must be handled. • The system suggests new prices based on the forecast. If the prices follow pricing rules, the test passes. If prices are not aligned with predefined limits, the error must be corrected.

User story

Epic	Ad Inventory Management
Persona	Data Analyst
User Story	As a Data Analyst, I want the system to provide inventory occupancy reports for radio stations, so I can monitor trends and optimize ad sales.
Acceptance Criteria	• The system must display a dashboard with current inventory occupancy by station and time slot. • The system must allow comparing historical occupancy data. • The system must allow data export to Excel/CSV.
Acceptance Tests	• The user accesses the dashboard and views the current inventory occupancy. If the data is accurate and up-to-date, the test passes. If there's data inconsistency, errors must be corrected. • The user exports the data for external analysis. If the data is correctly exported in CSV/Excel, the test passes. If there is an export failure, errors must be handled.

User story

Epic	Implementation of Smart Discounts
Persona	Sales Specialist
User Story	As a Sales Specialist, I want the system to suggest automatic discounts when inventory occupancy predictions are below target, to increase occupancy and prevent revenue loss.
Acceptance Criteria	• The system must identify low-occupancy periods and suggest discounts to attract advertisers. • Discounts must follow predefined rules (e.g., no more than 30% discount during high-demand periods).
Acceptance Tests	• The system identifies a period of low occupancy and suggests discounts. If discounts are applied correctly within rules, the test passes. If no discounts are suggested during low occupancy, the error must be corrected. • The sales team receives notifications about suggested discounts. If notifications are sent correctly, the test passes. If notifications fail or contain errors, the issue must be fixed.

User story

Epic	Price Impact Analysis
Persona	Financial Director
User Story	As the Financial Director, I want to monitor the impact of price changes on Rede Gazeta's revenue to evaluate the effectiveness of the dynamic pricing strategy
Acceptance Criteria	• The system must display graphs showing revenue trends over time. • The system must allow comparisons between dynamically adjusted prices and fixed prices. • The system must automatically generate financial impact reports.
Acceptance Tests	• The user accesses the dashboard and verifies revenue trends. If the graphs display correct information, the test passes. If there is data inconsistency, errors must be corrected. • The user generates a financial report on the impact of dynamic pricing. If the report is generated correctly, the test passes. If there is a report generation failure, the issue must be corrected.

User story

Epic	Ideal Price Calculation for Ads
Persona	Pricing Analyst
User Story	As a Pricing Analyst, I want the system to automatically calculate the ideal price for each advertising space, considering factors such as audience, demand, sales history, and seasonality, to maximize revenue and inventory occupancy.
Acceptance Criteria	• The system must calculate CPM (Cost Per Thousand Impressions) based on expected audience and standard price. • The ideal price calculation must consider historical data, seasonality, and demand. • The system must allow configuration of price adjustment rules, such as minimum and maximum limits.
Acceptance Tests	• The system receives audience, occupancy, and price history data and calculates CPM correctly. If CPM is calculated accurately, the test passes. If there is a calculation error, the issue must be corrected. • The system adjusts prices according to configured rules. If prices are adjusted correctly within the established limits, the test passes. If prices are suggested outside of the limits, the error must be corrected.

Definition of the Solution's Strategic Positioning and Understanding Its Business Impact

Sprint 3

Oportunidades

Challenges:

- Pricing is often conducted without accurate occupancy forecasts.
- Difficulty in dynamically adjusting prices based on demand and seasonality.
- Lack of integration between pricing, inventory, and financial impact analysis.
- Advertisers may resist dynamic pricing due to perceived instability.

Opportunities:

- Use of artificial intelligence to forecast occupancy and automatically adjust prices.
- Implementation of smart discounts to minimize idle inventory.
- Centralized dashboard for real-time monitoring of inventory and financial performance.

Key risks

- Resistance to change: Team and advertisers may resist the new pricing model.
- Inaccuracy in predictive models: Predictive models may fail, leading to inappropriate pricing.
- Brand perception: Price fluctuations may harm the radio's brand image.
- Market acceptance: The market may reject dynamic pricing.
- Dependency on external sources: Heavy reliance on third-party data.

Business model canva

Key Partners

- Technology and data infrastructure providers.
- Inteli students responsible for developing the artificial intelligence model and data analysis.
- Rede Gazeta's commercial team for strategy validation.

Key Activities

- Development and improvement of AI models.
- Data collection, processing, and analysis to train predictive models.
- Integration with Rede Gazeta's models.

Key Resources

- Advanced AI algorithms for demand forecasting.
- Historical database on audience, occupancy, and prices.
- Interactive dashboard for data analysis.

Value Propositions

- Automated dynamic pricing for advertising spaces.
- Maximization of ad inventory occupancy.
- Price adjustments based on seasonality, demand, and sales history.
- Strategic discount suggestions for revenue optimization.
- Detailed analysis of the impact of dynamic pricing on revenue.

Customer Relationship

- Technical support for platform usage during project development.
- Detailed documentation on the developed artifacts.

Channels

- Web platform with interactive dashboards.
- Excel reports.
- Email notifications for the team.
- API for integration with Rede Gazeta's internal systems.

Customer Segments

- Commercial managers: optimize pricing and inventory maximization.
- Data analysts: access detailed reports on occupancy and trends.
- Sales specialists: use automatic discount suggestions to prevent revenue loss.
- Advertisers and advertising agencies: benefit from competitive pricing and optimized opportunities.

Cost Structure

- Development and maintenance of the AI platform;
- Data processing infrastructure and cloud computing.
- Rede Gazeta team responsible for project monitoring and continuity.
- Training and support for the sales team.
- Monitoring and adjustments of the algorithms to maintain system efficiency.

Revenue Stream

- Optimization of advertising space utilization.
- Reduction of losses due to idle spaces.
- Maximization of profitability for each advertising space.
- Possible licensing of the technology to other radio networks in the future.

Market Exploration and External Factors That May Affect the Project

Sprint 4

SWOT

Strengths

- Use of artificial intelligence to optimize real-time pricing;
- Ability to maximize advertising space occupancy, reducing idle time;
- Use of historical and real-time data for more detailed demand analysis.

S

Weaknesses

- System integration challenges and team adaptation;
- Need for accurate, up-to-date data to ensure effectiveness;
- Potential resistance to change from staff and advertisers.

W

Opportunities

- Potential to tap into new markets and customer segments with more attractive pricing;
- Development of new offerings based on rapid response capabilities;
- New system in the market with room for growth.

O

Threats

- Risks associated with large-scale fluctuations;
- Competitors may implement similar strategies;
- Potential new data privacy regulations that could affect the project's operation.

T

Financial analysis

To ensure the success of the project, it is essential to understand both the initial investments (CAPEX) and the ongoing operational costs (OPEX). Below are the estimated costs:

Item	Estimated Cost
Platform development (AI, backend, and integration with Rede Gazeta's systems)	R\$ 300,000
Cloud infrastructure (first 12 months)	R\$ 60,000
Training for commercial, OPEP, and planning teams	R\$ 40,000
Marketing and communication strategy for advertisers	R\$ 30,000
Legal consulting and LGPD compliance	R\$ 20,000
Total Initial Investment (CAPEX)	R\$ 450,000

Análise PESTEL

A strategic tool that examines the Political, Economic, Social, Technological, Environmental, and Legal factors that may impact an organization or market.

P

Regulation by Anatel and the Ministry of Communications affects operations; legislative changes and election periods influence programming and commercial strategies.

E

Post-COVID recovery presents challenges such as high interest rates (Selic) and inflation; the sector is driven by local industries and seasonality, impacting advertising investments.

S

Growing use of podcasts and streaming platforms, yet strong loyalty to local radio stations that reinforce regional identity and promotion.

T

Digitalization and automation expand consumption (apps, streaming) and optimize operations, with AI being used for pricing and ad management.

E

Commitment to sustainability through energy efficiency initiatives and environmental awareness campaigns.

L

Compliance with broadcasting regulations, LGPD (Brazil's General Data Protection Law), and copyright laws ensures ethical and operational standards.

TAM SAM SOM

TAM (Total Addressable Market) refers to the overall available market – the total revenue or number of potential customers that could be reached if there were no geographical, operational, or competitive constraints. It represents the global market potential.

- SAM (Serviceable Addressable Market) represents the portion of the TAM that the company can actually serve with its products or services, considering its current capabilities and limitations, such as geographic reach and target segments.
- SOM (Serviceable Obtainable Market) is the share of the SAM that the company can realistically capture, taking into account competition, resources, and go-to-market strategies. It reflects the effectively reachable market in the short to medium term.

Expectations for the Next Module

- **Sprint 1: ETL and Data Pipeline**
 - Structuring the flow for ingesting, cleaning, and processing Rede Gazeta's historical data.
- **Sprint 2: AI Model Development**
 - Building and testing predictive models for forecasting inventory occupancy and suggesting pricing strategies.
- **Sprint 3: Pricing API**
 - Exposing endpoints for integration with dashboards and internal systems.
- **Sprint 4: Initial Dashboard Visualizations**
 - Creating interface prototypes for analyzing suggested prices and financial impact.
- **Sprint 5: Initial Technical Infrastructure**
 - Setting up a local or cloud-based architecture with scalability for future expansion.
